ZERO GRAVITY SOLUTIONS

Design the next system change

Work through one system change or cloud-workload decision. Map the current constraints, compare practical options and sequence a change your engineers can implement and validate.

The agreed scope

One workload, migration, boundary change or integration. For cost questions, agree the billing period, cost basis and available usage evidence.

What you receive

- Current and proposed system maps with ownership boundaries
- Options, tradeoffs, and a recorded architecture decision
- A sequenced backlog with validation points and recovery conditions

What we need from you

A system owner, current diagrams or source access, operating constraints and relevant usage or billing records.

How we judge the result

Compare options against the workload, reliability needs and delivery effort. Separate observed costs from allocation assumptions and potentially avoidable spend.

What happens next

Your engineers use the roadmap, or we scope the first implementation slice together.

Scope, fees, availability, and ongoing support are agreed before work begins.
